EECS 448 - Lab 04

Do the following:

1. Write a shell script (.sh) to create an html file

2. The filename of the html file should be index.html

3. The contents of the file should be

   <html>
   <head>
       <title>
       Directory listing
       </title>
   </head>
   <body>
       <h1>Index of files in {current directory}**</h1>
**
       ****{/path/to/file1}**
**
       ****{/path/to/file2}**
**
       . . .
       ****{/path/to/fileN}**
**
   </body>
   </html>

   (note: The links in the html file should point to the actual contents of the directory that you run the script from. The header should list the current directory)

4. The html file should be generated just by running `sh {yourscript}.sh` (or `./{yourscript}.sh`).

Deliverable: PDF containing the shell script (in a fixed-width font) and a screenshot of the webpage you generated.
